GLP-compliance

This study "*Predicted Environmental Concentrations in Surface Water for cyanamide and PERLKA based on FOCUS STEP3 Simulations maize, potatoes, sugar beet, grass, strawberries, and vegetables*" was conducted according to the procedures described herein. This report is a true and accurate record of the results obtained. There were no circumstances that may have adversely impacted the quality or integrity of the study.

The study does not describe an experimental study, so the GLP-regulation is not applicable. However, the study was performed in accordance to the "Codex of Good Modelling Practices" (Görlitz 1993 und Travis 1995).

1. Simulation models

For the calculations the computer tool SWASH was used which mainly creates the necessary input data for MACRO 5.5.4, PRZM 4.3.1 and TOXSWA 4.4 which were used for the simulations. All models are described in FOCUS (2001). The standard buffer was 1 m. They represent start of the art PEC-calculations for all type active compounds (pesticides, biocides and veterinary compound). They are also the most recent versions. The history of versions is summarised at the FOCUS homepage (<https://esdac.jrc.ec.europa.eu/projects/focus-dg-sante>).

2. Input parameters

2.1 Agricultural use pattern

PERLKA is applied in various crops with different application pattern as summarised in the following table.

Table 1: Application pattern of PERLKA in various crops considered for the simulations

Crop	App. method	Incorp. Depth (cm)	App. Rate (kg/ha)	Start of the application window
Maize	Incorporated	at 10 cm	400	14 days before emergence (= planting)
Potatoes	Incorporated	at 15 cm	400	14 days before emergence (= planting)
Sugar Beets	Incorporated	at 10 cm	350	14 days before emergence (= planting)
Sugar Beets	deep placement	at 10 cm	200	14 days before emergence (= planting)
cabbage*	Incorporated	at 15 cm	500	14 days before emergence (= time of planting)
cabbage*	Incorporated	at 15 cm	400	14 days before emergence (= time of planting)
cabbage*	Incorporated	at 10 cm	320 [^]	4 weeks after planting
Grass	Granular app	at 0 cm	300	March-April
Vegetables (fruiting)	Incorporated.	at 15 cm	200	14 days before emergence (= time of planting)
Vegetables (fruiting)	Granular app.	at 0 cm	200	14 days before emergence (= time of planting)

* The FOCUS crop "leafy vegetables" was used [^]400 kg/ha with 20% crop interception

Report: Predicted Environmental Concentration in Surface Water of Cyanamide and PERLKA based on FOCUS STEP3 - page 6/43 -

Based on the information given in Table 1 following application dates were automatically calculated for the different crops at the different scenarios.

2.2 Substance properties of Calcium Cyanamide (PERLKA) and Cyanamide

PERLKA

The maximum concentration of calcium cyanamide in PERLKA is about 45%. In order to adequately simulate the slow release of cyanamide from PERLKA granules to soil, cyanamide was defined as a metabolite. According to experimental data the half-life of

PERLKA (Ca CN₂) in soil was found to be between 0.60 days and 1.80 days. The experimental values were normalised to 20 °C using a Q₁₀ factor of 2.2 as recommended by FOCUS (2000). The experimental half-lives were also normalised to pF 2 (see appendix 1) using an exponent of 0.7 as the model requires degradation at optimised moisture conditions. Also the moisture correction was done according to FOCUS (2000). The geometric mean of all normalised half-lives was found to be 0.506 days. This value was considered for the modelling transformation in soil.

A half life of 1 day was considered for the water phase. This value was used as a minimum number for the simulation model FOCUS TOXSWA.

Cyanamide

According to experimental data cyanamide is further transformed to urea. Also for cyanamide the experimental half-lives were normalised to 20 °C using a Q₁₀-Factor of 2.2 as given by FOCUS (2000). However, for cyanamide no soil moisture normalisation was done since according to the experimental results the degradation of cyanamide does not increase with soil moisture. Consequently, the soil moisture correction in the models FOCUS MACRO and PRZM are not suitable and the moisture correction was switched off. For the modelling a half-life of 0.766 days was used. The value represents the geometric mean of all experimental data after normalisation to 20 °C but without soil moisture normalisation [see Klein 2018].

Furthermore, according to EFSA (2010) the half life of cyanamide in the water-sediment system is 3.5 days (geometric mean of two studies). According to the FOCUS recommendations, this value of 3.5 days must be considered for the transformation of cyanamide in water whereas a default value of 1000 days was considered for the sediment phase. The experimental disappearance time cannot be used for the modelling since it includes not only degradation but also transportation which is considered in the model separately.

All DegT₅₀ values in water, sediment-system and in soil considered in the simulations are presented in Table 3.

Table 3: DegT₅₀-values (d) of PERLKA and cyanamide

Parameter	PERLKA	Cyanamide
Water	1 (at 20 °C)	3.5 (at 20 °C)
Sediment	1 (at 20 °C)	1000 (at 20 °C)
Soil	0.506 (at 20 °C)	0.766 (at 20 °C)

The DegT50₅₀ values in soil represent geometric mean half lives of several studies which are summarised in the appendix

PERLKA granules cannot be dissolved in water without being transformed to cyanamide. In order to simulate the fate of PERLKA realistically the sorption constant in soil K_{OC} was set to an artificial, high number (172400 L/kg). That should guarantee that the granules remain at the applied location in soil and are only transformed to cyanamide without leaching to deeper soil layers. For PERLKA residues in surface water the same value was considered as for cyanamide.

For cyanamide an average (geomean) sorption constant of 4 L/kg was considered which was based on experimental sorption studies. It was considered more reliable than results based on the HPLC methodology.

Cyanamide has a Henry's law constant of 2.68 10⁻⁵ J/mol. However this value cannot be entered directly into the simulation model but will be internally calculated based on water solubility, vapour pressure and molecular mass.

Plant uptake was not considered since the granules are usually applied before emergence of the crop.

All other input parameters used for the simulations are summarised in Table 4.

Table 4: Other input parameters used for the simulations of PERLKA and Cyanamide

Parameter	PERLKA	Cyanamide	remark
Sorption constant KOC in soil (L/kg)	172400	4	EFSA (2010)
Sorption constant KOC in water body (L/kg)	0	4	EFSA (2010)

Plant uptake factor	0	0	default

* hydrogen cyanamide

3. Results

The global maximum concentrations for all scenarios and crops are summarised in the following Table 5. In total 94 FOCUS crop-location combinations were simulated.

The following maximum concentrations were calculated for cyanamide in the simulations:

Maize, 400kg, uniform incorp. 10 cm: 17.35 µg/L
Potatoes, 400kg, uniform incorp. 15 cm: 554.8 µg/L
Sugar beet, 350kg, uniform incorp. 10 cm: 672.8 µg/L
Sugar beet, 200kg, deep placement 10 cm: 0.000236 µg/L
Cabbage, 500kg, uniform incorp. 15 cm: 56.42 µg/L
Cabbage, 400kg, uniform incorp. 15 cm: 45.14 µg/L
Cabbage, 320kg, uniform incorp. 10 cm: 151.8 µg/L
Grassland, 300kg, uniform incorp. 0 cm: 1900.4 µg/L
Strawberries, 200kg, uniform incorp. 15 cm: 5.854 µg/L
Strawberries, 200kg, uniform incorp. 0 cm: 37.53 µg/L

Table 5: Global maximum concentrations of PERLKA and Cyanamide at FOCUS Step 3

4. Conclusions

The following maximum concentrations were calculated for cyanamide at step 3 simulations (no buffer strip to the surface water body):

Maize, 400kg, uniform incorp. 10 cm: 17.35 µg/L
Potatoes, 400kg, uniform incorp. 15 cm: 554.8 µg/L
Sugar beet, 350kg, uniform incorp. 10 cm: 672.8 µg/L
Sugar beet, 200kg, deep placement 10 cm: 0.000236 µg/L
Leafy vegetables, 400kg, uniform incorp. 15 cm: 45.14 µg/L
Cabbage, 500kg, uniform incorp. 15 cm: 56.42 µg/L
Cabbage, 320kg, uniform incorp. 10 cm: 54.16 µg/L
Grassland, 300kg, uniform incorp. 0 cm: 1900.4 µg/L
Strawberries, 200kg, uniform incorp. 15 cm: 5.854 µg/L
Strawberries, 200kg, uniform incorp. 0 cm: 37.53 µg/L

6. Appendix 1: Available Degradation studies and information on moisture correction

Laboratory degradation are undertaken at various moisture contents often between 40-50% MWHC. Additional data provided in study reports may include the actual moisture content of the soil during the study as volumetric (% volume/volume), or as gravimetric (% mass/mass). Other studies may define the reference soil moisture in terms of; % field capacity (FC), or as matric potential values such as pF, kPa or Bar. According to FOCUS (2000) a special procedure called “normalisation” has to be performed before an average value can be calculated.

For the normalisation following equation is used:

$$DT50_{pF2} = DT50_{exp} \cdot \left(\frac{\Theta_{exp}}{\Theta_{pF2}} \right)^{0.7}$$

DT50_{pF2}: DT50 value at moisture content pF2 (normalised condition)

DT50_{exp}: DT50 value at experimental conditions

Θ_{exp}: experimental soil moisture

Θ_{pF2}: normalised soil moisture (pF 2)

In the following table the resulting normalised values are presented for the transformation of Ca CN2 to cyanamide:

Table 6: Soil moisture normalisation of DT50 values of Ca CN2 to reference conditions (pF 2)

Soil	Soil type (USDA)	Moisture at pF2 (%) [*]	Moisture in the experiment (%)	normalisation factor	DT50 (at exp. soil moisture) in days	Dt50 at pF 2 in days
Refesol 01-A	Loamy sand	12	10	0.880	0.585	0.515
Refesol 01-A	Loamy sand	12	5	0.542	0.958	0.519
Refesol 02-A	Silt loam	26	21	0.861	0.463	0.399
Refesol 02-A	Silt loam	26	10.4	0.527	0.867	0.457
Refesol 01-A	Loamy sand	12	10	0.880	0.6	0.528
Refesol 01-A	Loamy sand	12	5	0.542	1.21	0.656
Geometric mean					0.546	0.506

^{*} These are default values taken from FOCUS (2000)

For cyanamide no soil moisture normalisation was done since according to the experimental results the degradation of cyanamide does not increase with soil moisture (see the following table). Consequently, the soil moisture correction in the models MACRO and PRZM are not suitable and the moisture correction was switched off in the simulation. For the modelling a half-life of 0.766 days was used. The value represents the geometric mean of all experimental data after normalisation to 20 °C but without soil moisture normalisation.

Studies on degradation (hydrolysis) of Ca CN₂ to cyanamide
