#### **GLP-compliance**

This study "Predicted Environmental Concentrations in Surface Water for cyanamide and PERLKA based on FOCUS STEP3 Simulations maize, potatoes, sugar beet, grass, strawberries, and vegetables" was conducted according to the procedures described herein. This report is a true an accurate record of the results obtained. There were no circumstances that may have adversely impacted the quality or integrity of the study.

The study does not describe an experimental study, so the GLP-regulation is not applicable. However, the study was performed in accordance to the "Codex of Good Modelling Practices" (Görlitz 1993 und Travis 1995).

# 1. <u>Simulation models</u>

For the calculations the computer tool SWASH was used which mainly creates the necessary input data for MACRO 5.5.4, PRZM 4.3.1 and TOXSWA 4.4 which were used for the simulations. All models are described in FOCUS (2001). The standard buffer was 1 m. The represent start of the art PEC-calculations for all type active compounds (pesticides, biocides and veterinary compound). They are also the most recent versions. The history of versions is summarised at the FOCUS homepage (https://esdac.jrc.ec.europa.eu/projects/focus-dg-sante).

# 2. <u>Input parameters</u>

# 2.1 Agricultural use pattern

PERLKA is applied in various crops with different application pattern as summarised in the following table.

Table 1: Application pattern of PERLKA in various crops considered for the simulations

Crop	App. method	Incorp. Depth (cm)	App. Rate (kg/ha)	Start of the application window
Maize	Incorporated	at 10 cm	400	14 days before emergence (= planting)
Potatoes	Incorporated	at 15 cm	400	14 days before emergence (= planting)
Sugar Beets	Incorporated	at 10 cm	350	14 days before emergence (= planting)
Sugar Beets	Incorporated	at 10 cm	200	14 days before emergence (= planting)
Leafy vegetables	Incorporated	at 15 cm	500	14 days before emergence (= planting)
Leafy vegetables	Incorporated	at 10 cm	320	14 days before emergence (= planting)
Grass	Granular app	at 0 cm	300	March-April
Vegetables (fruiting)	Incorporated.	at 15 cm	200	14 days before emergence (= planting)
Vegetables (fruiting)	Granular app.	at 0 cm	200	14 days before emergence (= planting)

# 2.2 Substance properties of Calcium Cyanamide (PERLKA) and Cyanamide

# **PERLKA**

The maximum concentration of calcium cyanamide in PERLKA is about 45%. In order to adequately simulate the slow release of cyanamide from PERLKA granules to soil, cyanamide was defined as a metabolite. According to experimental data the half-life of

Report: Predicted Environmental Concentration in Surface Water of
Cyanamide and PERLKA based on FOCUS STEP3 - page 8/43 -

PERLKA (Ca CN2) in soil was found to be between 0.60 days and 1.80 days. The experimental values were normalised to 20 °C using a Q10 factor of 2.2 as recommended by FOCUS (2000). The experimental half-lives were also normalised to pF 2 (see appendix 1) using an exponent of 0.7 as the model requires degradation at optimised moisture conditions. Also the moisture correction was done according to FOCUS (2000). The geometric mean of all normalised half-lives was found to be 0.506 days. This value was considered for the modelling transformation in soil.

A half life of 1 day) was considered for the water phase. This value was used as a minimum number for the simulation model FOCUS TOXSWA.

#### Cyanamide

According to experimental data cyanamide is further transformed to urea. Also for cyanamide the experimental half-lives were normalised to 20 °C using a Q10-Factor of 2.2 as given by FOCUS (2000). However, for cyanamide no soil moisture normalisation was done since according to the experimental results the degradation of cyanamide does not increase with soil moisture. Consequently, the soil moisture correction in the models FOCUS MACRO and PRZM are not suitable and the moisture correction was switched off. For the modelling a half-life of 0.766 days was used. The value represents the geometric mean of all experimental data after normalisation to 20 °C but without soil moisture normalisation [see Klein 2018].

Furthermore, according to EFSA (2010) the half life of cyanamide in the water-sediment system is 3.5 days (geometric mean of two studies). According to the FOCUS recommendations, this value of 3.5 days must be considered for the transformation of cyanamide in water whereas a default value of 1000 days was considered for the sediment phase. The experimental disappearance time cannot be used for the modelling since it includes not only degradation but also transportation which is considered in the model separately.

All DegT<sub>50</sub> values in water, sediment-system and in soil considered in the simulations are presented in Table 3.

Table 3: DegT<sub>50</sub>-values (d) of PERLKA and cyanamide

Parameter	PERLKA	Cyanamide
Water	1 (at 20 °C)	3.5 (at 20 °C)
Sediment	1 (at 20 °C)	1000 (at 20 °C)
Soil	0.506 (at 20 °C)	0.766 (at 20 °C)

Report: Predicted Environmental Concentration in Surface Water of
Cyanamide and PERLKA based on FOCUS STEP3 - page 9/43 -

The DegT50<sub>50</sub> values in soil represent geometric mean half lives of several studies which are summarised in the appendix

PERLKA granules cannot be dissolved in water without being transformed to cyanamide. In order to simulate the fate of PERLKA realistically the sorption constant in soil  $K_{\text{OC}}$  was set to an artificial, high number (172400 L/kg). That should guarantee that the granules remain at the applied location in soil and are only transformed to cyanamide without leaching to deeper soil layers. For PERLKA residues in surface water the same value was considered as for cyanamide.

For cyanamide an average (geomean) sorption constant of 4 L/kg was considered which was based on experimental sorption studies. It was considered more reliable than results based on the HPLC methodology.

Cyanamide has a Henry's law constant of 2.68 10<sup>-5</sup> J/mol. However this value cannot be entered directly into the simulation model but will be internally calculated based on water solubility, vapour pressure and molecular mass.

Plant uptake was not considered since the granules are usually applied before emergence of the crop.

All other input parameters used for the simulations are summarised in Table 4.

Table 4: Other input parameters used for the simulations of PERLKA and Cyanamide

Parameter	PERLKA	Cyanamide	remark
Sorption constant KOC in soil (L/kg)	172400	4	EFSA (2010)

# 3. Results

The global maximum concentrations for all scenarios and crops are summarised in the following Table 5. In total 94 FOCUS crop-location combinations were simulated.

The following maximum concentrations were calculated for cyanamide in the simulations:

Maize, 400kg, uniform incorp. 10 cm: 17.35  $\mu$ g/L Potatoes, 400kg, uniform incorp. 15 cm: 554.8  $\mu$ g/L Sugar beet, 350kg, uniform incorp. 10 cm: 672.8  $\mu$ g/L Sugar beet, 200kg, deep placement 10 cm: 0.000236  $\mu$ g/L Leafy vegetables, 400kg, uniform incorp. 15 cm: 45.14  $\mu$ g/L Cabbage, 500kg, uniform incorp. 15 cm: 56.42  $\mu$ g/L Cabbage, 320kg, uniform incorp. 10 cm: 54.16  $\mu$ g/L Grassland, 300kg, uniform incorp. 0 cm: 1900.4  $\mu$ g/L

Strawberries, 200kg, uniform incorp. 0 cm: 1900.4 µg/L Strawberries, 200kg, uniform incorp. 15 cm: 5.854 µg/L Strawberries, 200kg, uniform incorp. 0 cm: 37.53 µg/L

Cyanamide and PERLKA based on FOCUS STEP3 - page 17/43 -

#### 6. Appendix 1: Available Degraation studies and information on moisture correction

Laboratory degradation are undertaken at various moisture contents often between of 40-50% MWHC. Additional data provided in study reports may include the actual moisture content of the soil during the study as volumetric (% volume/volume), or as gravimetric (% mass/mass). Other studies may define the reference soil moisture in terms of; % field capacity (FC), or as matric potential values such as pF, kPa or Bar. According to FOCUS (2000) a special procedure called "normalisation" has to be performed before an average value can be calculated.

For the normalisation following equation is used:

$$DT50_{pF2} = DT50_{exp} \cdot \left(\frac{\Theta_{exp}}{\Theta_{pF2}}\right)^{0.7}$$

DT50<sub>pf2</sub>: DT50 value at moisture content pF2 (normalised condition)

DT50<sub>exp</sub>: DT50 value at experimental conditions

 $\Theta_{\text{exp}}$ : experimental soil moisture

 $\Theta_{pF2}$ : normalised soil moisture (pF 2)

Report: Predicted Environmental Concentration in Surface Water of
Cyanamide and PERLKA based on FOCUS STEP3 - page 18/43 -

In the following table the resulting normalised values are presented for the transformation of Ca CN2 to cyanamide:

Table 6: Soil moisture normalisation of DT50 values of Ca CN2 to reference conditions (pF 2)

			Moisture in			
		Moisture	the		DT50 (at exp.	
		at pF2	experiment	normalisation	soil moisture)	Dt50 at pF 2
Soil	Soil type (USDA)	(%)*	(%)	factor	in days	in days
Refesol 01-A	Loamy sand	12	10	0.880	0.585	0.515
Refesol 01-A	Loamy sand	12	5	0.542	0.958	0.519
Refesol 02-A	Silt loam	26	21	0.861	0.463	0.399
Refesol 02-A	Silt loam	26	10.4	0.527	0.867	0.457
Refesol 01-A	Loamy sand	12	10	0.880	0.6	0.528
Refesol 01-A	Loamy sand	12	5	0.542	1.21	0.656
			G	eometric mean	0.546	0.506

<sup>\*</sup> These are default values taken from FOCUS (2000)

For cyanamide no soil moisture normalisation was done since according to the experimental results the degradation of cyanamide does not increase with soil moisture (see the following table). Consequently, the soil moisture correction in the models MACRO and PRZM are not suitable and the moisture correction was switched off in the simulation. For the modelling a half-life of 0.766 days was used. The value represents the geometric mean of all experimental data after normalisation to 20 °C but without soil moisture normalisation.

Report: Predicted Environmental Concentration in Surface Water of
Cyanamide and PERLKA based on FOCUS STEP3 - page 19/43 -

Studies on degradation (hydrolysis) of Ca CN2 to cyanamide

Table 7: DT50 values of cyanamide under different conditions

Study	Soil	Temperature (°C)e	exp. soil moisture	DT50 after normalisation to 20 °C (days)
Güthner	Refesol 01-A	12	10%	1.171
	Refesol 01-A	12	5%	0.692
Weinfurtner	Refesol 02-A	12	21%	0.506
	Refesol 02-A,	12	10.4%	0.420
Weinfurtner.	Refesol 01-A	20	10%	0.820
	Refesol 01-A	20	5%	0.770
	Sandy Loam (Ashland, USA)	20		0.700
	Loamy sand (SP 257)	20		0.960
	Loamy sand (SP 357)	20		1.240
	Geometric mean (only temperate	ature normalisation	)	0.766

# 7. Appendix 2: SWASH Report Files

#### 7.1 Maize, 400 kg, uniform incorp. 10 cm

```
* SWASH report file

* made by FOCUS-SWASH UI v. 5 (internal version 5.1.0, 02 April 2015)

*

* File Name : E:\SwashProjects\CN2_M2\CN2_M2_report.txt

* Description : Maize, 400kg, uniform incorp. 10 cm

* Substance : CN2Gr

*

* Creation : 24-Sep-2018, 12:42

*

* Remarks : SWASH report helps you to set up the needed runs to calculate the PECsw and PECsed, occuring in the EU

* for the selected substance, used on the selected crop. The scenario code informs you which models you need to

* run for this scenario.

* D1-D6: drainage entries calculated by the MACRO model, fate in surface water calculated by the TOXSWA model

*

* R1-R4: runoff and erosion entries calculated by the PRZM model, fate in surface water calculated by the TOXSWA model
```

Report: Predicted Environmental Concentration in Surface Water of Cyanamide based on FOCUS STEP3 - page 38/43 -

```
* SWASH report file
* made by FOCUS-SWASH UI v. 5 (internal version 5.1.0, 02 April 2015)
* File Name : E:\SwashProjects\CN2_GR\CN2_GR_report.txt
* Description : Grassland, 300kg, uniform incorp. 0 cm
* Substance : CN2Gr
* Creation
             : 24-Sep-2018, 10:19
* Remarks : SWASH report helps you to set up the needed runs to calculate the PECsw and PECsed, occuring in the EU
           for the selected substance, used on the selected crop. The scenario code informs you which models you need to
           run for this scenario.
           D1-D6: drainage entries calculated by the MACRO model, fate in surface water calculated by the TOXSWA model
           R1-R4: runoff and erosion entries calculated by the PRZM model, fate in surface water calculated by the TOXSWA model
           For STREAMS the Mean Deposition and Mass Loading, as calculated by the FOCUS Drift Calculator, have been multiplied by a
           factor 1.2 to account for pesticide mass incoming from the upstream catchment as decided by the FOCUS Surface Water
           Scenarios Working Group.
```
